Please, check every detail (design elements, dimensions, positions, texts etc.), before you approve this PDF or Color Proof. Even if this is another corrected version of PDF or Proof check it with the same care as first time. Proof is to be understood simple as a guide how colors, and relations between them, should look like after printing. In reality the average tolerance for color appearance is targeted to be under  $\Delta E(cmc) = 3.0$ , for inks that aren't overprints, measured on target patch, only if target patch is possible to include on print. Even if the Proof or printed sample are choosen as a matching reference, in the case when PMS colors are present on the design, we will try to match PMS values rather than Proof appearance. With your approval of this color proof and/or PDF preview, you release us from responsibility for any mistake that is traceable back to you, and that you agree with instructions given above.
